

FRACTIONAL ABLATIVE SKIN RESURFACING

StarLux® 500 fractional ablative skin resurfacing is a single-treatment procedure where a powerful laser creates tiny, microscopic columns in damaged and unsightly areas of your skin. The healthy skin surrounding the columns helps the columns to heal, often within 2-4 days.

The result from this treatment is noticeably tighter skin, less pigment, and a visible improvement on your skin's appearance. Our advanced skin resurfacing treatment triggers a deep healing process that replaces treated areas with fresh, glowing skin.

Other StarLux® Treatments

We have chosen the Palomar StarLux® Laser and Pulsed Light System because it offers the most versatile, effective, and comfortable aesthetic treatments available. In addition to fractional ablative skin resurfacing, the StarLux offers treatments such as non-ablative skin resurfacing, permanent hair reduction, photofacials (for the clearance of sunspots, rosacea, and spider veins), fractional skin tightening through soft tissue coagulation, acne treatment, leg vein clearance, and more.

FREQUENTLY ASKED QUESTIONS

How does StarLux® 500 Fractional Ablative Skin Resurfacing Work?

Our Palomar Lux2940™ fractional ablative laser handpiece directs thermal energy into the skin via hundreds of tiny microbeams. Unsightly skin is selectively vaporized, and within a few days is replaced with fresh, healthy skin—generated by the body's lymphatic system.

What Makes StarLux® 500 Fractional Ablative Skin Resurfacing Different From Other Ablative Methods?

Some ablative skin resurfacing methods remove a major portion of the skin's surface. While good results are eventually seen, the drawbacks include prolonged red and raw skin, longer downtime periods and a higher risk of infection.

Are These Treatments Painful? What Should I expect After Treatment?

You may expect redness, warmth, swelling, or tightness in the treated area, with a range in downtime of 2-4 days. During this period, your skin is healing and regenerating. You are advised to stay out of the sun, avoid scrubbing, and not wear makeup after treatment.

For several weeks after treatment, depending on the type of treatment and areas treated, your skin may appear pinkish in tone, which is normal. Makeup can be applied typically after 4 days, reducing this temporary tone irregularity.

Unlike other skin rejuvenation treatments, our Lux2940™ fractional ablative skin resurfacing treatment is a single day procedure.

Want To Discuss Further Options?

If you are interested in deep corrections, and if an average 4-day recovery period fits your schedule, ask for more information about StarLux® 500 fractional ablative skin resurfacing and expected outcomes.
